

DominionC2 – Threat Emulation Framework

Resilient multi-agent C2 threat emulation for Android tactical endpoints and cyber ranges.

Problem

Tactical Android devices (ATAK, COMSEC, battlefield applications) are increasingly targeted by advanced adversaries, yet there is a critical lack of realistic, resilient C2 threat emulation tools to test their security in controlled environments – from military cyber ranges to corporate BYOD audits.

Solution – DominionC2

DominionC2 is a dual-use, multi-agent Command & Control (C2) framework that emulates real-world threats against Android endpoints. It enables operators to simultaneously manage multiple agents, retrieve sensitive data (GPS, contacts, SMS, call logs, clipboard), execute shell commands, record audio/video/screen, and export structured reports – even under degraded network conditions.

Key Differentiators

- **Resilient file transfer** – Three-step file size stabilization + exponential backoff (RFC 7230 compliant).
- **Multi-agent by design** – Dynamic device list, auto-refresh, sessionStorage persistence.
- **Legal & transparent** – Physical agent installation, explicit user permission prompts – not a covert spyware.
- **Modular architecture** – Easy to extend with new commands.
- **Instant reporting** – One-click export to CSV, PDF, XLSX.

Target Markets & Dual-Use Applications

- **Military / NATO:** Cyber range training, COMSEC auditing, ATAK resilience testing, adversary emulation.
- **Commercial:** Insider threat detection, mobile DLP validation, penetration testing of BYOD environments (banking, critical infrastructure).
- **Red Teams & Pentesters:** Authorised Android security assessments with real-time C2 capabilities.

Current Status (TRL 4)

Fully functional prototype demonstrated on multiple AVD emulators and physical devices. Core features validated in a laboratory environment.

Next milestone (TRL 5-6): Validation in a military cyber range / operational environment – planned with DIANA Phase 2 or equivalent funding.

Funding Request

Amount requested: €50,000 – €100,000 (or equivalent in PLN) in exchange for equity (negotiable).

Use of funds:

-  Expand the team (2-3 developers) – 60%
-  Prepare for cyber range validation (TRL 5-6) – 20%
-  Legal, IP protection, documentation – 10%
-  Marketing, business development – 10%

Team

Dawid Wordliczek – Founder & Lead Security Researcher. Certified in red teaming (OSCP, Ex CRTP and CARTP, CRT0 and CRTL in progress). Full-stack developer

(Python/Flask) and Android native (Kotlin).

Built the entire platform from scratch.

Planned hires (funded by grant/investment): Cyber Security Developers x 5, Security QA engineer, Managers for each team (Android, iOS).
